README

Qt Mustache

qt-mustache is a simple library for rendering **Mustache templates**.

Example Usage

```
“cpp #include "mustache.h"
```

```
QVariantHash contact; contact["name"] = "John Smith"; contact["email"] = "john.smith@gmail.com";
```

```
QString contactTemplate = "<b>{{name}}</b> <a href='mailto:{{email}}'>{{email}}";
```

```
Mustache::Renderer renderer; Mustache::QtVariantContext context(contact);
```

```
QTextStream output(stdout); output << renderer.render(contactTemplate, &context); “
```

Outputs: John Smith john.smith@gmail.com

For further examples, see the tests in `test_mustache.cpp`

Building

- To build the tests, run `qmake` followed by `make`
- To use qt-mustache in your project, just add the `mustache.h` and `mustache.cpp` files to your project.

License

qt-mustache is licensed under the BSD license.

Dependencies

qt-mustache depends on the QtCore library. It is compatible with Qt 4 and Qt 5.

Usage

Syntax

qt-mustache uses the standard Mustache syntax. See the [Mustache manual](#) for details.

Data Sources

qt-mustache expands Mustache tags using values from a [Mustache::Context](#). [Mustache::QtVariantContext](#) is a simple context implementation which wraps a `QVariantHash` or `QVariantMap`. If you want to render a template using a custom data source, you can either create a `QVariantHash` which mirrors the data source or you can re-implement [Mustache::Context](#).

Partials

When a `{{>partial}}` Mustache tag is encountered, qt-mustache will attempt to load the partial using a [Mustache::PartialResolver](#) provided by the context. [Mustache::PartialMap](#) is a simple resolver which takes a `QHash<QString,QString>` map of partial names to values and looks up partials in that map. [Mustache::PartialFileLoader](#) is another simple resolver which fetches partials from `<partial name>.mustache` files in a specified directory.

You can re-implement the [Mustache::PartialResolver](#) interface if you want to load partials from a custom source (eg. a database).

Error Handling

If an error occurs when rendering a template, `Mustache::Renderer::errorPosition()` is set to non-negative value and template rendering stops. If the error occurs whilst rendering a partial template, `errorPartial()` contains the name of the partial.

Lambdas

The [Mustache manual](#) provides a mechanism to customize rendering of template sections by setting the value for a tag to a callable object (eg. a lambda in Ruby or Javascript), which takes the unrendered block of text for a template section and renders it itself. qt-mustache supports this via the `Context::canEval()` and `Context::eval()` methods.

QTestRunner

A repo for Increase QTest productivity

Thanks to <https://marcoarena.wordpress.com/2012/06/23/increase-your-qtest-productivity/>!

The QTestLib framework is a tool for unit testing Qt based applications and libraries. I find it precious and simple to use, though it lacks some important features, supported, for example, by GTest. I'm not talking about mocking – for this you generally need an out-and-out framework (like GMock) – instead, I'm referring to simple things like fast deploying. Suppose you have written a test class like this:

This repo contains only the code in this article.

- [PartialResolver](#) * [partialResolver](#) () const
- virtual bool [canEval](#) (const QString &key) const
- virtual QString [eval](#) (const QString &key, const QString &_template, [Renderer](#) *renderer)

8.21.1 Detailed Description

[Context](#) is an interface that [Mustache::Renderer::render\(\)](#) uses to fetch substitutions for template tags.

8.21.2 Constructor & Destructor Documentation

8.21.2.1 `Context::Context (PartialResolver * resolver = 0)` `[explicit]`

Create a context. *resolver* is used to fetch the expansions for any `{{>partial}}` tags which appear in a template.

8.21.3 Member Function Documentation

8.21.3.1 `bool Context::canEval (const QString & key) const` `[virtual]`

Returns true if [eval\(\)](#) should be used to render section tags using *key*. If [canEval\(\)](#) returns true for a key, the renderer will pass the literal, unrendered block of text for the section to [eval\(\)](#) and replace the section with the result.

[canEval\(\)](#) and [eval\(\)](#) are equivalents for callable objects (eg. lambdas) in other Mustache implementations.

The default implementation always returns false.

Reimplemented in [CounterContext](#), [CounterContext](#), and [Mustache::QtVariantContext](#).

8.21.3.2 `QString Context::eval (const QString & key, const QString & _template, Renderer * renderer)` `[virtual]`

Callback used to render a template section with the given *key*. *renderer* will substitute the original section tag with the result of [eval\(\)](#).

The default implementation returns an empty string.

Reimplemented in [CounterContext](#), [CounterContext](#), and [Mustache::QtVariantContext](#).

8.21.3.3 `virtual bool Mustache::Context::isFalse (const QString & key) const` `[pure virtual]`

Returns true if the value for *key* is 'false' or an empty list. 'False' values typically include empty strings, the boolean value false etc.

When processing a section Mustache tag, the section is not rendered if the key is false, or for an inverted section tag, the section is only rendered if the key is false.

Implemented in [Mustache::QtVariantContext](#).

8.21.3.4 `virtual int Mustache::Context::listCount (const QString & key) const` `[pure virtual]`

Returns the number of items in the list value for *key* or 0 if the value for *key* is not a list.

Implemented in [Mustache::QtVariantContext](#).

8.21.3.5 `PartialResolver * Context::partialResolver () const`

Returns the partial resolver passed to the constructor.

8.21.3.6 `QString Context::partialValue (const QString & key) const`

Returns the partial template for a given *key*.

8.21.3.7 virtual void Mustache::Context::pop () [pure virtual]

Exit the current context.

Implemented in [Mustache::QtVariantContext](#).

8.21.3.8 virtual void Mustache::Context::push (const QString & key, int index = -1) [pure virtual]

Set the current context to the value for `key`. If `index` is ≥ 0 , set the current context to the `index`'th value in the list value for `key`.

Implemented in [Mustache::QtVariantContext](#).

8.21.3.9 virtual QString Mustache::Context::stringValue (const QString & key) const [pure virtual]

Returns a string representation of the value for `key` in the current context. This is used to replace a Mustache value tag.

Implemented in [CounterContext](#), [CounterContext](#), and [Mustache::QtVariantContext](#).

8.30.1 Member Function Documentation

8.30.1.1 virtual bool CounterContext::canEval (const QString & key) const [inline], [virtual]

Returns true if [eval\(\)](#) should be used to render section tags using `key`. If [canEval\(\)](#) returns true for a key, the renderer will pass the literal, unrendered block of text for the section to [eval\(\)](#) and replace the section with the result.

[canEval\(\)](#) and [eval\(\)](#) are equivalents for callable objects (eg. lambdas) in other Mustache implementations.

The default implementation always returns false.

Reimplemented from [Mustache::QtVariantContext](#).

8.30.1.2 `virtual bool CounterContext::canEval (const QString & key) const [inline],[virtual]`

Returns true if [eval\(\)](#) should be used to render section tags using `key`. If [canEval\(\)](#) returns true for a key, the renderer will pass the literal, unrendered block of text for the section to [eval\(\)](#) and replace the section with the result.

[canEval\(\)](#) and [eval\(\)](#) are equivalents for callable objects (eg. lambdas) in other Mustache implementations.

The default implementation always returns false.

Reimplemented from [Mustache::QtVariantContext](#).

8.30.1.3 `virtual QString CounterContext::eval (const QString & key, const QString & _template, Mustache::Renderer * renderer) [inline],[virtual]`

Callback used to render a template section with the given `key`. `renderer` will substitute the original section tag with the result of [eval\(\)](#).

The default implementation returns an empty string.

Reimplemented from [Mustache::QtVariantContext](#).

8.30.1.4 `virtual QString CounterContext::eval (const QString & key, const QString & _template, Mustache::Renderer * renderer) [inline],[virtual]`

Callback used to render a template section with the given `key`. `renderer` will substitute the original section tag with the result of [eval\(\)](#).

The default implementation returns an empty string.

Reimplemented from [Mustache::QtVariantContext](#).

8.30.1.5 `virtual QString CounterContext::stringValue (const QString & key) const [inline],[virtual]`

Returns a string representation of the value for `key` in the current context. This is used to replace a Mustache value tag.

Reimplemented from [Mustache::QtVariantContext](#).

8.30.1.6 `virtual QString CounterContext::stringValue (const QString & key) const [inline],[virtual]`

Returns a string representation of the value for `key` in the current context. This is used to replace a Mustache value tag.

Reimplemented from [Mustache::QtVariantContext](#).

8.66.1 Detailed Description

A context implementation which wraps a QVariantHash or QVariantMap.

8.66.2 Member Typedef Documentation

8.66.2.1 `typedef QString(* Mustache::QtVariantContext::fn_t)(const QString &, Mustache::Renderer *, Mustache::Context *)`

Construct a [QtVariantContext](#) which wraps a dictionary in a [QVariantHash](#) or a [QVariantMap](#).

8.66.3 Member Function Documentation

8.66.3.1 `bool QtVariantContext::canEval (const QString & key) const` [virtual]

Returns true if [eval\(\)](#) should be used to render section tags using `key`. If [canEval\(\)](#) returns true for a key, the renderer will pass the literal, unrendered block of text for the section to [eval\(\)](#) and replace the section with the result.

[canEval\(\)](#) and [eval\(\)](#) are equivalents for callable objects (eg. lambdas) in other Mustache implementations.

The default implementation always returns false.

Reimplemented from [Mustache::Context](#).

Reimplemented in [CounterContext](#), and [CounterContext](#).

8.66.3.2 `QString QtVariantContext::eval (const QString & key, const QString & _template, Mustache::Renderer * renderer)` [virtual]

Callback used to render a template section with the given `key`. `renderer` will substitute the original section tag with the result of [eval\(\)](#).

The default implementation returns an empty string.

Reimplemented from [Mustache::Context](#).

Reimplemented in [CounterContext](#), and [CounterContext](#).

8.66.3.3 `bool QtVariantContext::isFalse (const QString & key) const` [virtual]

Returns true if the value for `key` is 'false' or an empty list. 'False' values typically include empty strings, the boolean value false etc.

When processing a section Mustache tag, the section is not rendered if the key is false, or for an inverted section tag, the section is only rendered if the key is false.

Implements [Mustache::Context](#).

8.66.3.4 `int QtVariantContext::listCount (const QString & key) const` [virtual]

Returns the number of items in the list value for `key` or 0 if the value for `key` is not a list.

Implements [Mustache::Context](#).

8.66.3.5 `void QtVariantContext::pop ()` [virtual]

Exit the current context.

Implements [Mustache::Context](#).

8.66.3.6 `void QtVariantContext::push (const QString & key, int index = -1)` [virtual]

Set the current context to the value for `key`. If `index` is ≥ 0 , set the current context to the `index`'th value in the list value for `key`.

Implements [Mustache::Context](#).

8.66.3.7 `QString QtVariantContext::stringValue (const QString & key) const` [virtual]

Returns a string representation of the value for `key` in the current context. This is used to replace a Mustache value tag.

Implements [Mustache::Context](#).

Reimplemented in [CounterContext](#), and [CounterContext](#).
